

Vascular Pattern Recognition

Introduction

Vascular Pattern Recognition, also commonly referred to as Vein Pattern Authentication, is a fairly new biometric in terms of installed systems. Using near-infrared light, reflected or transmitted images of blood vessels of a hand or finger are derived and used for personal recognition. Different vendors use different parts of the hand, palms, or fingers, but rely on a similar methodology. Researchers have determined that the vascular pattern of the human body is unique to a specific individual and does not change as people age. Claims for the technology include that it:

- is difficult to forge – Vascular patterns are difficult to recreate because they are inside the hand and, for some approaches, blood needs to flow to register an image.
- is contact-less – Users do not touch the sensing surface, which addresses hygiene concerns and improves user acceptance.
- has many and varied uses – It is deployed in ATMs, hospitals, and universities in Japan. Applications include ID verification, high security physical access control, high security network data access, and POS access control.
- is capable of 1:1 and 1:many matching – Users' vascular patterns are matched against personalized ID cards/smart cards or against a database of many scanned vascular patterns.

History

Potential for the use of this technology can be traced to a paper prepared in 1992 by Dr. K. Shimizu¹, in which he discussed optical trans-body imaging and potential optical CT scanning applications. In 1996, author Yamamoto K², in conjunction with K. Shimizu, presented another paper in which the two discussed research they had undertaken since the earlier paper.

The first research paper about the use of vascular patterns for biometric recognition was published in 2000.³ This paper describes the technology that uses the subcutaneous blood vessel pattern in the back of the hands and that was to become the first

commercially available vascular pattern recognition system in 2000. Additional research has further improved the technology.^{4,5,6} The introduction of this technology inspired additional research and commercialization into finger- and palm-based systems.^{7,8}

Approach

Vascular pattern in the back of hands

Near-infrared rays generated from a bank of light emitting diodes (LEDs) penetrate the skin of the back of the hand. Due to the difference in absorbance of blood vessels and other tissues, the reflected near-infrared rays produce an image on the sensor. The image is digitized and further processed by image processing techniques producing the extracted vascular pattern. From the extracted vascular pattern, various feature data such as vessel branching points, vessel thickness, and branching angles are extracted and stored as the template.

Vascular pattern in fingers

The basic principle of this technology is shown in Figures 1 & 2. Near-infrared rays generated from a bank of LEDs penetrate the finger or hand and are absorbed by the hemoglobin in the blood. The areas in which the rays are absorbed (i.e., veins) appear as dark areas similar to a shadow in an image taken by a Charge-Coupled Device (CCD) camera. Image processing can then construct a vein pattern from the captured image. Next this pattern is digitized and compressed so that it can be registered as a template.

United States Government Evaluations

The US Government has not performed technology evaluations of vascular pattern recognition biometrics at this time.

Summary

Vascular pattern recognition has gained sponsorship from companies that have developed reputations for developing products that compete successfully in global markets. There appears to be some testing and validation by third parties. Standards work will need to be accomplished before this technology can grow to broader acceptance.

About the National Science and Technology Council

The National Science and Technology Council (NSTC) was established by Executive Order on November 23, 1993. This Cabinet-level Council is the principal means within the executive branch to coordinate science and technology policy across the diverse entities that make up the Federal research and development enterprise. Chaired by the President, the membership of the NSTC is made up of the Vice President, the Director of the Office of Science and Technology Policy, Cabinet Secretaries and Agency Heads with significant science and technology responsibilities, and other White House officials.

A primary objective of the NSTC is the establishment of clear national goals for Federal science and technology investments in a broad array of areas spanning virtually all the mission areas of the executive branch. The Council prepares research and development strategies that are coordinated across Federal agencies to form investment packages aimed at accomplishing multiple national goals. The work of the NSTC is organized under four primary committees; Science, Technology, Environment and Natural Resources and Homeland and National Security. Each of these committees oversees a number of sub-committees and interagency working groups focused on different aspects of science and technology and working to coordinate the various agencies across the federal government. Additional information is available at www.ostp.gov/nstc.

About the Subcommittee on Biometrics

The NSTC Subcommittee on Biometrics serves as part of the internal deliberative process of the NSTC. Reporting to and

directed by the Committee on Homeland & National Security and the Committee on Technology, the Subcommittee:

- Develops and implements multi-agency investment strategies that advance biometric sciences to meet public and private needs;
- Coordinates biometrics-related activities that are of interagency importance;
- Facilitates the inclusions of privacy-protecting principles in biometric system design;
- Ensures a consistent message about biometrics and government initiatives when agencies interact with Congress, the press and the public;
- Strengthen international and public sector partnerships to foster the advancement of biometric technologies.

Additional information on the Subcommittee is available at www.biometrics.gov.
